# 4 Installation

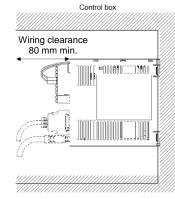

# 4.1 Installation

#### **Warning**

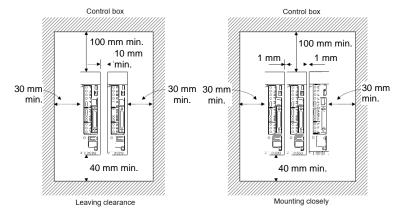

- Do not install the product unless the safety instructions have been read and understood.
- Design the installation so that the temperature surrounding the driver is within the specified operating temperature. Leave enough space between the drivers so that the operating temperature of the drivers remains within the specification range.
- A regenerative resistor is mounted on the back of the LECSA. The regenerative resistor causes a temperature rise of 100°C relative to the ambient temperature. Fully examine heat dissipation and the installation position before installing the driver.
- Install a cooling fan if necessary.
- The driver must be mounted vertically with sufficient space at the top and bottom of the driver as shown below.
- Allow 80 mm minimum space between the front of the driver and a door (lid) so that the connectors can be connected and disconnected.
- When installing a number of drivers together, leave a minimum of 1 mm between adjacent drivers, allowing for mounting tolerances. In this case, operate the drivers at a reduced ambient temperature of 0°C to 45°C, or at 75 % or less of the effective load ratio.
- The driver must be installed in a metal cabinet (control box).

#### Installation of single driver

#### Installation of 2 or more drivers

#### 4.2 Mounting

• The driver should be mounted vertically onto a panel using screws tightened to the required tightening torque.

#### **Caution**

If the mounting surface for the driver is not flat or is uneven, excessive stress may be applied to the enclosure, which can cause failure. Be sure to mount on a flat surface.

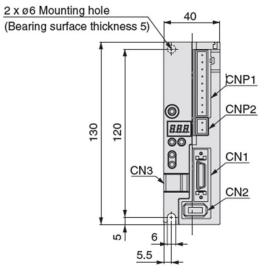

#### 4.3 Environment

#### Warning

- Do not use the product in the presence of flammable, explosive or corrosive gases, chemicals, salt water or steam.
- This product does not have an explosion proof construction.
- Do not expose to direct sunlight. Use a suitable protective cover.

## **Caution**

- Do not perform wiring while the power is on.
- Confirm proper insulation of wiring.
- Use only the specified cables.
- Ensure that the driver and servo motor are installed securely before wiring commences.
- Wire the connector correctly and securely.
- Check the connector for polarity and do not apply any voltage to the terminals other than those specified.
- Take appropriate measures against noise. Noise in a signal line may cause malfunction
- Do not route wires and cables together with power or high voltage cables.
- Keep wiring as short as possible to prevent interference from electromagnetic noise and surge voltage.
- Do not use the product in a place where electrical surges are generated
- Use suitable surge protection when a surge generating load such as a solenoid valve is to be directly driven.
- Take care that actuator movement does not catch the cables.

## 5.1 Wiring

#### Single phase 200 to 230 VAC or Single phase 100 to 120 VAC

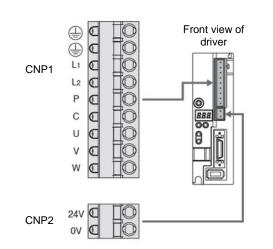

#### 5.2 Ground connection

- Provide grounding to ensure correct operation and to improve noise resistance of the product.
- This product should be individually grounded using a short cable.
- A dedicated Ground connection must be used. Grounding should be to a D-class ground (ground resistance of 100  $\Omega$  maximum).
- The cross-sectional area of the ground cable shall be 2 mm<sup>2</sup> minimum.

# Warning

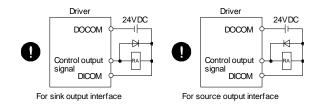

- Do not install the driver, servo motor or the regeneration option, on or near combustible materials.
- Always use a magnetic contactor between the main circuit power supply and the "L" terminals of the driver. Configure the wiring to ensure the power supply can be turned off at the driver. The magnetic contactor prevents a continuous large current flow if the driver malfunctions.
- When a regenerative resistor is used, monitor the resistor temperature and cut the main power to the driver if the temperature exceeds safe levels, otherwise the regenerative resistor will fail and there is a risk of fire.
- Remove the built-in regenerative resistor and it's wiring from the driver when adding an external regeneration unit (LECSA series).
- Provide adequate protection to prevent foreign matter from entering the driver and servo motor.
- Always connect a circuit breaker to the power supply of the driver.

# 5 Wiring (continued)

- Before disconnecting the CNP1 connector from the driver, ensure that the regenerative resistor has been disconnected.
- Install and wire the equipment correctly and securely. Otherwise, the servo motor may operate unexpectedly.
- Do not install a power capacitor, surge suppressor or radio noise filter (FR-BIF option) between the servo motor and the driver.
- Connect the wires to the correct phase terminals (U, V, W) of the driver and servo motor.
- Connect the servo motor power terminal (U, V, W) directly to the servo motor power input terminals (U, V, W). Otherwise a malfunction or fault may occur.

- Do not connect AC power directly to the servo motor. Otherwise, it may cause a malfunction.
- The surge absorbing diode installed to the DC relay for control output should be fitted with correct polarity. Otherwise, the emergency stop and other protective circuits may not operate.

• Tighten the cables to the specified torque. When cables are loose, the cable or terminal block (connector) will generate heat due to poor contact.

#### 6 Setting

In order to move the electric actuator to a specific position, it is necessary to set up the patterns of operation with a PC using the driver setting software. This set up data will be recorded in the memory of the driver.

Point table data describes the data that sets items of operation (such as positioning width) excluding speed, position, acceleration, and deceleration. Point table data will become effective as soon as it is recorded into the driver.

The driver has an LED display to show the servo status and alarm details, and parameter setting switches.

Refer to the Operation Manual on the SMC website (URL: <u>https://www.smcworld.com</u>) for further setting details.
